

Create multiple parent directories with mkdir

You have a directory `/home/mydir` and you want to create two new directories like this:
`/home/mydir/backup/something`

When you run `mkdir /home/mydir/backup/something` you will get an error:

```
mkdir: cannot create directory '/home/mydir/backup/something': No such file or directory
```

Normally, you would have to make both directories separately like `mkdir /home/mydir/backup`
`/home/mydir/backup/something`

Add the `-p` flag (*make parent directories along the way if needed*) to fix it:

```
mkdir -p /home/mydir/backup/something
```

`mkdir` created both `backup` and `something` directory in the same path
